

Class 6 Science · Ch 2 Worksheet A · Plant Classification

Total marks: **14** · Questions: **9**

Instructions: Practise identifying types of plants by stem, leaf, and root.

Q1. A short plant with a soft, green stem is called [1 mark]

- (A) a herb
- (B) a shrub
- (C) a tree
- (D) a creeper

Q2. Plants with a single main thick root and side branches have a [1 mark]

- (A) fibrous root
- (B) taproot
- (C) aerial root
- (D) prop root

Q3. Leaves with veins running side by side are said to have [1 mark]

- (A) parallel venation
- (B) reticulate venation
- (C) random venation
- (D) no venation

Q4. A medium-sized plant with a hard, branching stem near the base is called a _____. [1 mark]

Q5. A seed that splits into two halves is called a _____. [1 mark]

Q6. Plants with reticulate venation usually have a fibrous root system. [1 mark]

- (A) True
- (B) False

Q7. How would you tell a herb from a tree by looking at it? [2 marks]

Q8. You find a plant with reticulate-veined leaves. Predict what type of root system and seed structure it likely has, with reasons. [3 marks]

Q9. Make a chart of 6 common plants in your area. For each, note: name, herb/shrub/tree, leaf venation, and dicot/monocot. [3 marks]

Answer Key

Class 6 Science · Ch 2 Worksheet A · Plant Classification

Q1. A short plant with a soft, green stem is called

Answer: a herb

Herbs are short plants with soft stems (e.g., tulsi).

MCQ · EASY · 6-SCI-DLW-02

Q2. Plants with a single main thick root and side branches have a

Answer: taproot

Taproots have one main root with smaller side roots.

MCQ · EASY · 6-SCI-DLW-02

Q3. Leaves with veins running side by side are said to have

Answer: parallel venation

Parallel venation is seen in grass, maize, etc.

MCQ · EASY · 6-SCI-DLW-02

Q4. A medium-sized plant with a hard, branching stem near the base is called a _____.

Answer: shrub

Rose and lemon are common shrubs.

FILL_BLANK · EASY · 6-SCI-DLW-02

Q5. A seed that splits into two halves is called a _____.

Answer: dicot

Dicots have two cotyledons (e.g., gram, mango).

FILL_BLANK · EASY · 6-SCI-DLW-02

Q6. Plants with reticulate venation usually have a fibrous root system.

Answer: False

Reticulate venation is paired with taproots; parallel venation goes with fibrous roots.

TRUE_FALSE · MEDIUM · 6-SCI-DLW-02

Q7. How would you tell a herb from a tree by looking at it?

Answer: A herb is short with a soft, green stem. A tree is tall with a thick, hard, woody stem.

Tests the visual distinguishing features.

SHORT_ANSWER · MEDIUM · 6-SCI-DLW-02

Q8. You find a plant with reticulate-veined leaves. Predict what type of root system and seed structure it likely has, with reasons.

Answer: It likely has a taproot and dicot seeds. Reticulate venation (net-like veins) is typically paired with taproots and dicots in plant classification.

Tests applying the link between visual features and underlying classification.

SHORT_ANSWER · HARD · 6-SCI-DLW-04

Q9. Make a chart of 6 common plants in your area. For each, note: name, herb/shrub/tree, leaf venation, and dicot/monocot.

Answer: Sample chart: Tulsi — herb — reticulate — dicot. Rose — shrub — reticulate — dicot. Mango — tree — reticulate — dicot. Grass — herb — parallel — monocot. Maize — herb — parallel — monocot. Hibiscus — shrub — reticulate — dicot. Any 6 plants with consistent classifications accepted.

Tests creating a classification chart from observations.

LONG_ANSWER · HARD · 6-SCI-DLW-04
